

Works completely offline, with on-device AI.

# I'M BUILDING THE **POKEDEX** FOR THE **REAL** **WORLD**

Tech to help me understand  
the world better.

1

# WHAT'S A POKÉDEX?

In Pokémon, you point it at a creature and it tells you what you're looking at. Same idea here - just pointed at real bugs, birds, and plants instead.

2

# WHY HARDWARE, WHY NOW

Flip phones are back. Wired headphones are back. Parents are hosting swap fairs to trade smartphones for something simpler. What's new is the other half: small AI models now run entirely on the hardware itself, no server, no signal, so a device can be genuinely smart without anything on it to disconnect from.

3

# MEET SCOUT.

A handheld, two-screen field unit. Point it at something alive and it tells you what it is.

No app, no account, no subscription, nothing to sign into.

4

# DESIGN PRINCIPLES

- 1/ Does one job well: naming what's in front of you.
- 2/ Fun enough that you pick it up without being told to.
- 3/ Built to make you look up, not down at a screen.
- 4/ Voice first, wherever that's possible.
- 5/ Small enough to carry yourself, not something that lives in a bag.

5

## THE SCAN DOME

A 60mm magenta dome, ringed like a camera shutter, sized so you find it in two seconds. Left hand on the D-pad, right thumb on the dome. That's it.

6

# TWO SCREENS, ONE GOAL

A color screen wakes only to scan, then goes black. A black-and-white e-ink screen holds the library and map at zero power. The handoff between them is timed to look like a Polaroid developing.

7

# ASK IT ANYTHING

Fully offline speech-to-text, a small AI model trained only on nature, and a spoken answer back. No cloud call, no signal required.

# THE LIVE MAP

Every find drops a GPS pin on a map. The same location data also feeds a web twin built on Cesium, the open-source 3D geospatial engine, so a walk around the block turns into an actual 3D globe you can fly back over later.

24 design revisions. Zero parts ordered.

**YOU CAN'T HOLD IT  
YET. BUT YOU CAN  
TRY IT.**

Every screen, every button, the whole find-and-scan loop, already live and clickable. More going up here as the build continues.

**TRY THE SIMULATOR →**
